## WILCOXON SIGNED-RANK TEST

The sample has size  $n$ .

$P$  is the sum of the ranks corresponding to the positive differences.

$Q$  is the sum of the ranks corresponding to the negative differences.

$T$  is the smaller of  $P$  and  $Q$ .

For each value of  $n$  the table gives the **largest** value of  $T$  which will lead to rejection of the null hypothesis at the level of significance indicated.

**Critical values of  $T$**

	Level of significance			
	0.05	0.025	0.01	0.005
One-tailed	0.05	0.025	0.01	0.005
Two-tailed	0.1	0.05	0.02	0.01
$n = 6$	2	0		
7	3	2	0	
8	5	3	1	0
9	8	5	3	1
10	10	8	5	3
11	13	10	7	5

18	47	40	32	27
19	53	46	37	32
20	60	52	43	37

For larger values of  $n$ , each of  $P$  and  $Q$  can be approximated by the normal distribution with mean  $\frac{1}{4}n(n+1)$  and variance  $\frac{1}{24}n(n+1)(2n+1)$ .

## WILCOXON RANK-SUM TEST

The two samples have sizes  $m$  and  $n$ , where  $m \leq n$ .

$R_m$  is the sum of the ranks of the items in the sample of size  $m$ .

$W$  is the smaller of  $R_m$  and  $m(n + m + 1) - R_m$ .

For each pair of values of  $m$  and  $n$ , the table gives the **largest** value of  $W$  which will lead to rejection of the null hypothesis at the level of significance indicated.
